Design of Plated Structures Darko Beg 2012-01-09 The main aim of this book is to provide practical advice to designers of plated structures for correct and efficient application of EN 1993-1-5 design rules. In chapter 1 the purpose, the scope and the structure of the book is explained. In chapter 2 a rather detailed and commented overview of EN 1993-1-5 design rules is given following the structure of the standard. Shear lag effect as well as plate buckling problems due to direct stresses, shear forces, transverse forces and interactions of these effects are covered. This chapter also includes a reduced stress method and a finite element analysis approach to plate buckling problems. A large number of design examples illustrate the proper application of individual design rules. Chapter 3 and 4 bring two complete design examples on a crane runway and a box-girder bridge.

Design in Modular Construction Mark Lawson 2014-02-24 Modular construction can dramatically improve efficiency in construction, through factory production of pre-engineered building units and their delivery to the site either as entire buildings or as substantial elements. The required technology and application are developing rapidly, but design is still in its infancy. Good design requires a knowledge of modular production, installation and interface issues and also an understanding of the economics and client-related benefits which influence design decisions. Looking at eight recent projects, along with background information, this guide gives you coverage of: generic types of module and their application vertical loading, stability and robustness dimensional and spacial planning hybrid construction cladding, services and building physics fire safety and thermal and acoustic performance logistical aspects – such as transport, tolerances and safe installation. A valuable guide for professionals and a thorough introduction for advanced students.

Trichloroethylene, Tetrachloroethylene and Some Other Chlorinated Agents International Agency for Research on Cancer 2015-09-30 This publication provides an assessment of the carcinogenic hazards associated with exposure to seven chlorinated solvents, including trichloroethylene, tetrachloroethylene, and their metabolites (dichloroacetic acid, trichloroacetic acid, and chloral hydrate). All these agents were previously assessed by IARC Working Groups more than 10 years ago, and new epidemiological and mechanistic evidence has been considered in this reevaluation. Trichloroethylene has been used in several industries, such as manufacture and repair of aircraft and automobiles, and in screw-cutting, while tetrachloroethylene is widely used in dry-cleaning and as a feedstock for the production of chlorinated chemicals.

Thin-Walled Structures J.Y. Richard Liew 1998-11-27 Thin-plated structures are used extensively in building construction, automobile, aircraft, shipbuilding and other industries because of a number of favourable factors such as high strength-weight ratio, development of new materials and processes and the availability of efficient analytical methods. This class of structure is made by joining thin plates together at their edges and they rely for their rigidity and strength upon the tremendous stiffness and load-carrying capacity of the flat plates from which they are made. Many of the problems encountered in these structures arise because of the effects of local buckling. The knowledge of various facets of this phenomenon has increased dramatically since the 1960s. Problem areas which were hitherto either too complex for rigorous analysis or whose subtleties were not fully realized have in these years been subjected to intensive study. Great advances have been made in the areas of inelastic buckling. The growth in use of lightweight strong materials, such as fibre-reinforced plastics has also been a contributory factor towards the need for advances in the knowledge of the far post-buckling range. The conference is a sequel to the international conference organised by the University of Strathclyde in December 1996 and this international gathering will provide the opportunity for discussion of recent developments and trends in design of thin-walled structures.

Thin-Walled Structures - Advances and Developments J. Zaras 2001-06-18 This volume contains the papers presented at the Third International Conference on Thin-Walled Structures, Cracow, Poland on June 5-7, 2001. There has been a substantial growth in knowledge in the field of Thin-Walled Structures over the past few decades. Lightweight structures are in widespread use in the Civil Engineering, Mechanical Engineering, Aeronautical, Automobile, Chemical and Offshore Engineering fields. The development of new processes, new methods of connections, new materials has gone hand-in-hand with the evolution of advanced analytical methods suitable for dealing with the increasing complexity of the design work involved in ensuring safety and confidence in the finished products. Of particular importance with regard to the analytical process is the growth in use of the finite element method. This method, about 40 years ago, was confined to rather specialist use, mainly in the aeronautical field, because of its requirements for substantial calculation capacity. The development over recent years of extremely powerful microcomputers has ensured that the application of the finite element method is now possible for problems in all fields of engineering, and a variety of finite element packages have been developed to enhance the ease of use and the availability of the method in the engineering design process.

Design Capacity Tables for Structural Steel Hollow Sections Australian Steel Institute 1992 Regarded as a "must have" design aid for engineers, designers, fabricators and other specifiers of structural steel, the Design Capacity Tables for Structural Steel (DCT) provides information for the design and detailing of structural steel members and connections. Data is presented in the limit states format of AS 4100. Volume 1 of the DCT contains information on the readily available range of "open" structural steel sections (WB,WC, UB, UC, PFC, TFC, TFB, EA & UA). Also included are BHP Grade 300PLUSTM, the new "Lean Beams", and incorporation of Amendments 1 and 2 to AS 4100. Significant enhancements have been made to the second edition, including improved table layout and easy to read design curves. Data in the DCT includes: dimensions and section properties; design section capacities; values for fire design; and design capacities for members subject to bending, shear, bearing, axial compression, axial tension and combined actions. Also included are design capacities for bolts, welds and floor plates; elastic buckling loads; detailing parameters; section properties for gantry girders and rails; and useful tables for angles subjects to flexural loadings about their rectangular axes (restrained and unrestrained) and angles in trusses. Volume 2 of the DCT (DCTv2ed2) provides up-to-date information on the full range of Australian manufactured hollow sections complying with AS 1163. Additionally, the 1998 version of AS 4100 included some significant changes to the hollow section design provisions. These changes have also been incorporated in DCTv2ed2. Other features of DCTv2ed2 include tables associated with section properties, surface areas, telescoping sections, maximum design loads for simply supported beams with full lateral restraint, design section moment (including torsion) and web capacities, design moment capacities for members without full lateral restraint and design member capacities in axial compression/tension. The text includes data used to generate the tables, information relevant to common applications, useful examples and noting of clauses/equations in AS 4100 which are specific to hollow sections.
