**Law: A Very Short Introduction** Raymond Wacks 2008-03-27 Law underlies our society - it protects our rights, imposes duties on each of us, and establishes a framework for the conduct of almost every social, political, and economic activity. The punishment of crime, compensation of the injured, and the enforcement of contracts are merely some of the tasks of a modern legal system. It also strives to achieve justice, promote freedom, and protect our security. The result is a system that, while it touches all of our daily lives, is properly understood by only a few, with its impenetrable jargon, obsolete procedures, and interminable stream of Byzantine statutes and judgments of the courts. This clear, jargon-free Very Short Introduction aims to redress that balance, as it introduces the essentials of law and legal systems in a lively, accessible, and stimulating manner. Explaining the main concepts, terms, and processes of the legal system, it focuses on the Western tradition (the common law and the civil law), but also includes discussions of other legal systems, such as customary law and Islamic law. And it looks to the future too, as globalization and rapid advances in technology place increasing strain on our current legal system. ABOUT THE SERIES: The Very Short Introductions series from Oxford University Press contains hundreds of titles in almost every subject area. These pocket-sized books are the perfect way to get ahead in a new subject quickly. Our expert authors combine facts, analysis, perspective, new ideas, and enthusiasm to make interesting and challenging topics highly readable. **Career Development in Bioengineering and Biotechnology** Guruprasad Madhavan 2008-11-01 This indispensable guide provides a roadmap to the broad and varied career development opportunities in bioengineering, biotechnology, and related fields. **Learning to Rank for Information Retrieval and Natural Language Processing, Second Edition** Hang Li 2022-05-31 Learning to rank refers to machine learning techniques for training a model in a ranking task. Learning to rank is useful for many applications in information retrieval, natural language processing, and data mining. Intensive studies have been conducted on its problems recently, and significant progress has been made. This lecture gives an introduction to the area including the fundamental problems, major approaches, theories, applications, and future work. The author begins by showing that various ranking problems in information retrieval and natural language processing can be formalized as two basic ranking tasks, namely ranking creation (or simply ranking) and ranking aggregation. In ranking creation, given a request, one wants to generate a ranking list of offerings based on the features derived from the request and the offerings. In ranking aggregation, given a request, as well as a number of ranking lists of offerings, one wants to generate a new ranking list of the offerings. Ranking creation (or ranking) is the major problem in learning to rank. It is usually formalized as a supervised learning task. The author gives detailed explanations on learning for ranking creation and ranking aggregation, including training and testing, evaluation, feature creation, and major approaches. Many methods have been proposed for ranking creation. The methods can be categorized as the pointwise, pairwise, and listwise approaches according to the loss functions they employ. They can also be categorized according to the techniques they employ, such as the SVM based, Boosting based, and Neural Network based approaches. The author also introduces some popular learning to rank methods in details. These include: PRank, OC SVM, McRank, Ranking SVM, IR SVM, GBRank, RankNet, ListNet & ListMLE, AdaRank, SVM MAP, SoftRank, LambdaRank, LambdaMART, Borda Count, Markov Chain, and CRanking. The author explains several example applications of learning to rank including web search, collaborative filtering, definition search, keyphrase extraction, query dependent summarization, and re-ranking in machine translation. A formulation of learning for ranking creation is given in the statistical learning framework. Ongoing and future research directions for learning to rank are also discussed. **Left for Dead** Pete Nelson 2002-05-14 For fans of sea battles, adventures, and war stories like Unbroken, this is the incredible true story of a boy who helps to bring closure to the survivors of the tragic sinking of the USS Indianapolis, and helps exonerate the ship's captain fifty years later. Hunter Scott first learned about the sinking of the USS Indianapolis by watching the movie Jaws when he was just eleven-years-old. This was fifty years after the ship had sunk, throwing more than 1,000 men into shark-infested waters—a long fifty years in which justice still had not been served. It was just after midnight on July 30, 1945 when the USS Indianapolis was torpedoed by a Japanese submarine. Those who survived the fiery sinking—some injured, many without life jackets—struggled to stay afloat as they waited for rescue. But the United States Navy did not even know they were missing. As time went on, the Navy needed a scapegoat for this disaster. So it court-martialed the captain for “hazarding” his ship. The survivors of the Indianapolis knew that their captain was not to blame. For fifty years they worked to clear his name, even after his untimely death. But the navy would not budge—not until Hunter entered the picture. His history fair project on the Indianapolis soon became a crusade to restore the captain's good name and the honor of the men who served under him.
